Instructions Feedback

Create a Directory

Dana from the **Human Resources** department needs a working directory right away. Make sure only the right people can use it.

- Create a directory on the **server** named `ahF6i` in the `/var` directory.
  - Owner: **dana**
  - Group: **humanresources**
  - Permissions: **owner and group** can **read, write and execute**; others have no permissions.

Create a Script and Execute It

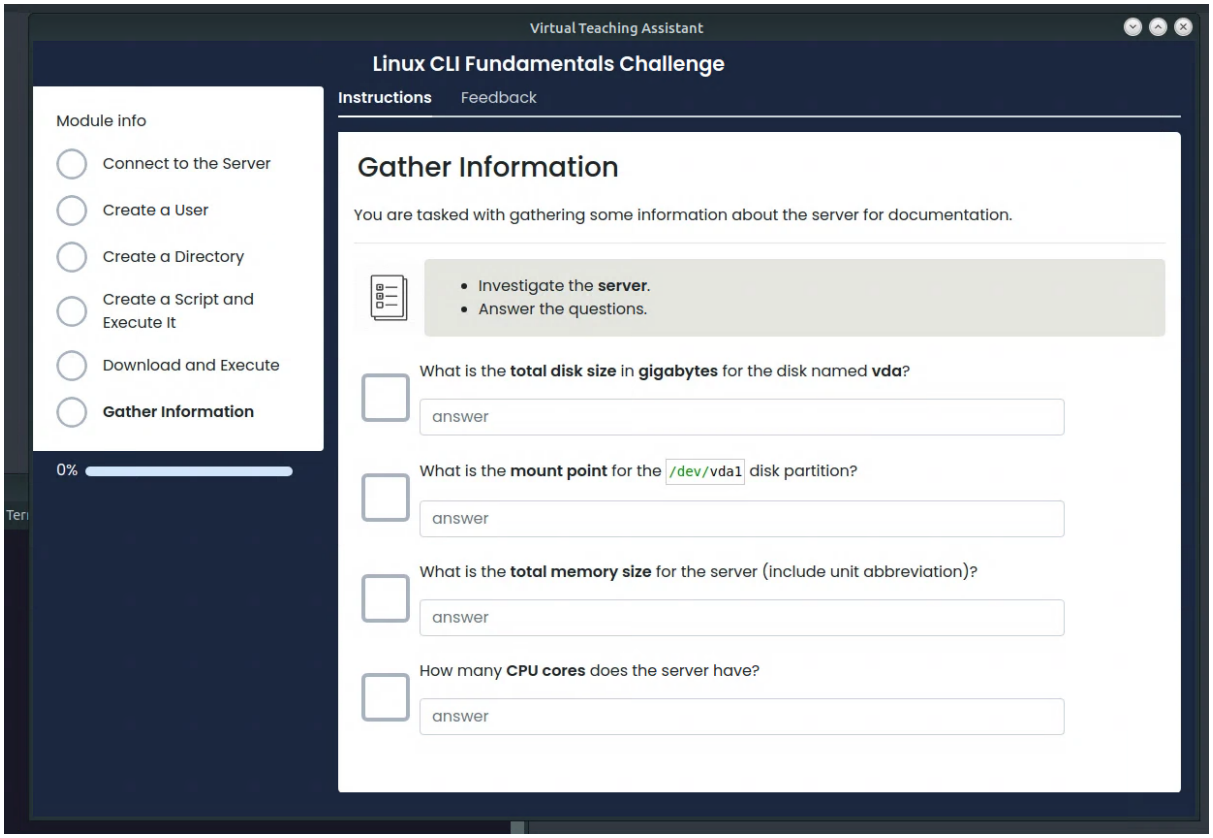

Weirdly enough, `figlet` and `lolcat` are some of the most used software in this company. You create a script that installs these packages. This makes it easier to install them into other servers later on.

- Create a **Bash script** on the **server** named `irving.sh` in the `/root/` directory that:
  - **Updates** the `apt` package list.
  - **Installs** the packages `figlet` and `lolcat` with `apt` without asking for confirmation.
  - **Clears out** the local `apt` repository of retrieved package files.
- Execute the script.

Download and Execute
One of the seniors asked you to run a script they wrote. You never trust a colleague's script blindly, so you capture its error output just in case.
Download the script https://devops.lab/detroit.sh into the server's /home/student directory.
Execute the downloaded script and send standard error to /home/student/detroit-errors.txt.

Gather Information
You are tasked with gathering some information about the server for documentation.
Investigate the server.
Answer the questions.
What is the total disk size in gigabytes for the disk named vda?
answer
What is the mount point for the /dev/vda1 disk partition?
answer
What is the total memory size for the server (include unit abbreviation)?
answer
How many CPU cores does the server have?
answer
